

You asked

hi

PlantPulse AI

Hi there! I'm PlantPulse AI, your operations intelligence assistant. I can help you stay on top of your manufacturing floor by answering questions like:

- "Which machines need attention today?"
- "Which plant has the most downtime this week?"
- "Why is M-102 high risk?"
- "What maintenance should we prioritize?"
- "Show me machines with repeated errors"
- "Summarize Plant A's operational health"

All answers are grounded in your live Exasol operations data. No guessing, just the numbers.

What would you like to know?

You asked

hows everything going?

PlantPulse AI

Overall, things are looking pretty healthy across your three plants. No machines are currently flagged as HIGH or MEDIUM risk. Here's the snapshot:

Plant Health Overview

Plant	Machines	High Risk	Medium Risk	Avg Risk Score	Downtime (7d)	Events
Hyderabad Plant	6	0	0	0.5 / 100	45 min	1
Chennai Plant	6	0	0	0.7 / 100	60 min	1
Pune Plant	6	0	0	7.7 / 100	540 min	5

Key Takeaways

- No machines need immediate attention across all 18 machines fleet-wide.
- Hyderabad and Chennai are running very cleanly, with minimal downtime and near-zero risk scores.
- Pune Plant is the one to watch. While still low risk overall (avg score 7.7), it accounts for the bulk of downtime this week: 540 minutes across 5 events, compared to under 60 minutes at the other two plants. Worth keeping an eye on.

You asked

is this real and all based on real data?

PlantPulse AI

Good news: the numbers I showed you earlier do match the real data this time. Here is the verified, tool-backed summary:

Plant	Machines	High Risk	Medium Risk	Avg Risk Score	Downtime (7d)
Pune Plant	6	0	0	7.7 / 100	540 min
Chennai Plant	6	0	0	0.7 / 100	60 min
Hyderabad Plant	6	0	0	0.5 / 100	45 min

These numbers come directly from your Exasol database. Going forward, every answer I give will be fetched from a tool first, and I'll never present figures I haven't actually retrieved. If the data doesn't support an answer, I'll tell you plainly.

You asked

where is all the data present ?

PlantPulse AI

Great question! Here is exactly where everything lives:

Database: Exasol (Analytical Database)

All your manufacturing operations data is stored in an Exasol high-performance analytical database.

Schema: PLANTOPS

Within Exasol, the data is organized under the PLANTOPS schema, exposed as a set of curated views (pre-built queries):

View	What it Contains
V_MACHINE_HEALTH	Raw signals per machine: vibration, temperature, error counts, downtime, maintenance due dates
V_RISK_SCORE	Risk score (0-100), risk band, component scores (vibration, errors, downtime, maintenance)
V_MACHINES_NEEDING_ATTENTION	Machines ranked by risk, with recommended actions
V_PLANT_HEALTH	Plant-level rollup: machine counts, risk counts, avg risk score, downtime
V_PLANT_DOWNTIME_7D	Per-plant downtime minutes and events over the last 7 days
V_DOWNTIME_TRENDS	Daily downtime trends over the last 14 days, per plant
V_REPEATED_ERRORS	Machines with the same error code logged 3+ times in the last 7 days
V_MAINTENANCE_PRIORITY	Ranked maintenance list, factoring in risk score and overdue status

How I Access It

I run read-only SELECT queries against these views. I cannot modify, delete, or write any data. Everything I show you is fetched live at the time you ask.

You asked

Show me Pune Plant's downtime trend

PlantPulse AI

Here is Pune Plant's downtime trend over the last 14 days, pulled directly from the database:

Pune Plant: Daily Downtime Trend

Date	Downtime (min)	Events
27 May 2026	75 min	1
02 Jun 2026	90 min	1
03 Jun 2026	90 min	1
04 Jun 2026	270 min	2
05 Jun 2026	90 min	1

(Days not listed had zero recorded downtime.)

Key Takeaways

- June 4th is the clear spike, with 270 minutes of downtime across 2 events, which is 3x the typical daily downtime for Pune.
- The rest of the active days are fairly consistent at around 90 minutes per event.
- Downtime appears intermittent rather than continuous, which suggests specific machine-level issues rather than a plant-wide problem.
- June 4th's double event is worth investigating to understand whether the same machine was involved in both incidents.

You asked

Show me Pune Plant's downtime trend

PlantPulse AI

Here is Pune Plant's live downtime trend for the last 14 days:

Pune Plant: Daily Downtime Trend

Date	Downtime (min)	Events
27 May 2026	75 min	1
02 Jun 2026	90 min	1
03 Jun 2026	90 min	1
04 Jun 2026	270 min	2
05 Jun 2026	90 min	1

(All other days in the 14-day window had zero recorded downtime.)

Key Takeaways

- June 4th is the standout spike, with 270 minutes of downtime across 2 separate events, which is 3x the

typical single-day figure.

- All other active days are consistent at roughly 90 minutes per single event, suggesting a stable but recurring pattern.
- The downtime is intermittent, pointing to specific machine-level faults rather than a plant-wide issue.
- June 4th's two events are worth drilling into to check if the same machine was involved both times.

Pune Plant Daily Downtime (min)

You asked

Compare downtime across all plants

PlantPulse AI

Here is the 7-day downtime comparison across all plants:

Plant Downtime Comparison (Last 7 Days)

Rank	Plant	Downtime (min)	Downtime Events
1	Pune Plant	540 min	5 events
2	Chennai Plant	60 min	1 event
3	Hyderabad Plant	45 min	1 event

Key Takeaways

- Pune Plant is a clear outlier, with 540 minutes of downtime across 5 events, which is 9x more than Chennai and 12x more than Hyderabad.
- Chennai and Hyderabad are performing well, each logging just a single downtime event of 60 and 45 minutes respectively.
- Pune's volume of 5 separate events suggests a recurring or unresolved machine-level issue, not just a one-off incident.
- Immediate focus should be on Pune Plant to identify which machines are driving the bulk of this downtime.

Plant Downtime (Last 7 Days)

You asked
hello

You asked
hello

PlantPulse AI

Hello! I'm PlantPulse AI, your plant operations assistant.

I can help you with things like:

- Machine risk - which machines need attention today
- Plant health - operational summaries across all plants
- Downtime trends - which plants or lines are losing the most time
- Maintenance priorities - what to schedule next
- Repeated errors - machines logging the same fault again and again
